

ABSTRACT

A dispensing device for paper sheets cut from a continuous band wound up in a roll has a case with a base and a cover provided with a bottom opening as paper outlet. The device further has a mechanism for automatically replacing the finished roll with a spare roll, and a band feeding and cutting unit. Moreover, the starting tip of the spare roll is retained, the cover is hinged to the base and a push on the cover is turned into a driving impulse for the feeding and cutting unit. The cover is provided with an inclined plane internally projecting downward at the area of nipping of the paper by the feeding and cutting unit. The user can cause the driving of the feeding and cutting unit by pushing on the cover and thus make the tip come out when it is not automatically dispensed by the device.
